## Discussion

December 2006 can be characterized as a month of extremes. The first minutes of December ushered in the first winter storm of the season, bringing 13 inches of snow, and cooler temperatures to the area. November ended with warmer than average temperatures close to record highs. The beginning of December was quite the opposite with temperatures coming within 2 degrees of the record low on the $4^{\text {th }}$, and to within 3 degrees on the $5^{\text {th }}$. Temperatures rebounded to average for a day on the $10^{\text {th }}$, and stayed above average for the remainder of the month. After the $10^{\text {th }}$, temperatures were at least ten degrees higher than average 9 times, and twenty degrees above average 3 times, coming within 1 degree of the record high for the $31^{\text {st }}$. Even with the warming trend the latter two-thirds of the month, December 2006 was only the $10^{\text {th }}$ warmest December on record due to the unseasonably cool temperatures at the beginning of the month. Moisture wise, we were almost an inch above average, due mainly to two precipitation events during the month.
