## Discussion

With an average temperature of $25.8^{\circ}$ F, this month was the most "normal" February in DeKalb since 1977 . As usual, this does not tell the whole story. The month began with 9 straight days of above average temperatures and in fact, the first half of the month experienced only 2 days of below normal temperatures. The mercury peaked on the $15^{\text {th }}$ at an amazing $58^{\circ} \mathrm{F}$ as many of us went running to the store in need of BBQ supplies. The relief was short however as temperatures crashed 3 days later on the $18^{\text {th }}$ to a very unwelcome $-10^{\circ} \mathrm{F}$, the coldest temperature recorded here since Feb $1,2004$.

The dismal precipitation totals are reminiscent of last year's drought conditions, though hopefully not a sign of things to come, with a little over half of the normal precipitation for the month. The majority of this fell over a period of 2 days and includes a severe Thunderstorm on the $17^{\text {th }}$ which produced some pea size hail along with heavy rain, some sleet and even a couple of flurries- a little something for everyone.

As February is the last month of meteorological winter, it's time to take a last look at how this winter ranks overall. Although it has been quite variable, precipitation was just a little below normal for the 3 month period ( 4.85 " total, $5.15^{\prime \prime}$ avg), thanks to the abundance which fell in January. The average temperature for this winter was $26.0^{\circ} \mathrm{F}$, just a little above the normal of $23.3^{\circ} \mathrm{F}$. Finally, the $18.3^{\prime \prime}$ of snowfall for the winter ranks in the bottom third going back to 1966 , whereas we normally expect about 27'’ of snow between December and February.
