Discussion
In like a lion, out like a lamb? Well, almost. The first week of March gave us a significant snow event on the $6^{\text {th }}$ and $7^{\text {th }}$ that put 4 official inches on the ground. The snow didn't stick around long as the pattern shifted dramatically over the $2^{\text {nd }}$ week and we received a normal month's worth of precipitation in just 6 days- all of it rain, about half of which fell over the $12^{\text {th }}$ and $13^{\text {th }}$. These two days may be remembered by many as the first substantial outbreak of severe weather in the Midwest for 2006 . While many DeKalb area residents enjoyed the $50^{\circ}+$ temperatures, including the $65^{\circ}$ high on the $12^{\text {th }}$, this weather was associated with a larger system that produced over 100 tornadoes throughout most of Missouri and parts of central Illinois. Although the $03 / 06$ average temperatures suggest a fairly routine March, only 10 days saw daytime high temps at or above normal. The second half of the month, which saw below normal daily temperatures, also received an additional $0.6^{\prime \prime}$ of liquid precipitation; $0.12^{\prime \prime}$ which fell as $1.2^{\prime \prime}$ of snow on the $24^{\text {th }}$ and $25^{\text {th }}, 0.26^{\prime \prime}$ on the $28^{\text {th }}$, and 0.19 " on the last day to close out the month, bringing our year-to-date total almost 1.8 " above normal.

As the events of the $12^{\text {th }}$ and $13^{\text {th }}$ remind us, we are not immune to the destructive forces of Mother Nature - especially this time of the year. Take the time now to think about what you should do in case of a tornado.
