## Discussion

The June 2010 average (mean) temperature was slightly above the 30 -year (1971-2000) historical average at 70.7 degrees, which was 0.9 degrees above the historical average of 69.8 degrees. It appears that warmer-than-average nights, caused by cloudiness and high humidity due to frequent rainfall, contributed to the warmer-than-average mean temperature: while the monthly average high temperature was 80.3 degrees and 0.8 degrees below the historical average of 81.1 degrees, the monthly average low temperature was 61.1 degrees and 2.5 degrees above the historical average and the eighth greatest since 1948. High temperatures were above average between the $1^{\text {st }}$ and $5^{\text {th }}$, generally below average between the $6^{\text {th }}$ and $16^{\text {th }}$, and nearto above average during the latter half of the month; low temperatures were above average generally except when near- to slightly below average between the $3^{\text {rd }}$ and $10^{\text {th }}$ and in the month's final two days. No temperatures of 90 degrees or greater were recorded during the month.

The monthly total rainfall of 6.53 in . was substantially above the historical average of 4.56 in . and ranked ninth greatest on record since 1948 . Rainfall was frequent as rainfall of a trace or more was recorded on 20 of 30 days during month. Damaging straight-line winds associated with severe thunderstorms caused tree and property damage as well as power failure on the $12^{\text {th }}$ and $18^{\text {th }}$ within the city of DeKalb proper and nearby in Rochelle and the U.S. 30 corridor on the $23^{\text {rd }}$. As of the end of the month, year-to-date liquid equivalent precipitation was 19.35 in and 110 percent of the historical average. At present, 2010 is on pace to be the fifth consecutive year in which above-historical-average liquid-equivalent precipitation is recorded. With respect to soil conditions in the short-term, the 26 June NOAA Climate Prediction Center Crop Moisture Report (posted weekly at [http://www.cpc.ncep.noaa.gov/products/analysis_monitoring/regional_monitoring/cmi.gif](http://www.cpc.ncep.noaa.gov/products/analysis_monitoring/regional_monitoring/cmi.gif)) showed "abnormally moist" conditions in all northern Illinois and "wet" to "excessively wet" conditions in adjacent portions of southwestern Wisconsin, eastern Iowa, and central Illinois.
