Discussion
June 2011 featured a mean temperature near the historical (30-year, 1981-2010) average; the mean temperature of 69.9 degrees was 0.2 degrees above the historical average mean of 69.7 degrees. The high temperature anomaly was negative ( 0.7 degrees below the historical average) at the same time that the low temperature anomaly was positive ( 1.3 degrees above the historical average), a condition that, again, resulted from frequent cloudiness. Temperatures at the beginning of the month were slightly above historical averages before they transitioned well above average between the $4^{\text {th }}$ and $9^{\text {th }}$, when an early-season heat wave occurred. The high temperature of 97 degrees recorded on the $8^{\text {th }}$ represented the highest temperature recorded since 1 August 2006, when the high was 97 . A record-high temperature was achieved on the $9^{\text {th }}$, when 95 was recorded, the first daily high-temperature record broken during climatological summer (June-July-August) since the record broken was set in 1999 (on 9 June). Thereafter, temperatures fluctuated from near- to below-average values through the end of the month, with the most below-average conditions between the $11^{\text {th }}$ and $13^{\text {th }}$ and the $23^{\text {rd }}$ and $25^{\text {th }}$.

The month had 4.71 in . of liquid-equivalent precipitation, some 113 percent of the historical average of 4.18 in. Exactly two-thirds of the monthly rainfall (3.14 in.) occurred in association with thunderstorms on the morning of the $10^{\text {th }}$, when a mesoscale convective complex affected portions of northern Illinois. Thereafter, although comparatively light, precipitation exhibited wide temporal distribution. The 25 June Crop Moisture Index (http://www.cpc.ncep.noaa.gov/products/analysis monitoring/regional monitoring/cmi.gif) prepared by NOAA's Climate Prediction Center (CPC) indicated "slightly dry/favorably moist" crop moisture conditions across the northern Illinois climate divisions. However, the 25 June Palmer Drought Severity Index (PDSI) (http://www.cpc.ncep.noaa.gov/products/analysis monitoring/regional monitoring/palmer.gif) map, prepared also by the CPC, indicates a PDSI value of +3.0 to +3.9 , or "very moist spell," in the northeastern Illinois climate division. That is, long-term soil moisture is plentiful at this time.

Today, 30 June, marks the end of the 2010-2011 snow season, whose snowfall total was 48.2 in., some 135 percent of the historical (30-year, 1971-2000) average total of 35.8 in.

[^0]June 2011 Daily Highs and Lows with 1981-2010 Average Highs and Lows Prepared by Daniel J. Brouillette, NIU Weather Director

[^0]:    A. Dawson, D. Dziubla, B. Heartcell, T. Herman, R. Niesen, L. Schutte, and S. Strader-Cooperative Observers; D.J. Brouillette-Weather Director Special acknowledgment is given to Laura Schutte for serving as Summertime Observer-Director Liaison, Jeff Kilburg for expediting certain equipment replacements, and to Stephen Strader for spearheading a station improvement initiative. Their efforts have been significant and are appreciated.
