Discussion
August's mean temperature of $71.6^{\circ} \mathrm{F}$ was very close to the historical normal. Most of August included high temperatures that were within the middle to upper $80^{\text {'s }}$, with the highest temperature recorded on August $25^{\text {th }}$ at $94^{\circ} \mathrm{F}$. The lowest temperature for August was recorded on the $10^{\text {th }}, 17^{\text {th }}$, and $18^{\text {th }}$ at $52^{\circ} \mathrm{F}$. Comparing seasonal historical rankings for summer mean temperature (1966-2012), 2012 ranked as the fourth hottest with a mean temperature at $82.6^{\circ} \mathrm{F}$. The hottest summer was 1991 , with a mean temperature of $85.7^{\circ} \mathrm{F}$.

August's precipitation total was 1.86 in., which is about 2.45 in. less than August normal precipitation. In comparison to historical records extending to 1966 , August 2012's precipitation total ranks as the $7^{\text {th }}$ driest; the driest August was in 1970 at 1.11 in. These dry conditions have persisted throughout the summer season leading poor crop production for most of the Midwest. An examination of the most recent U.S. Drought Monitor suggests that most of the Midwest is still under an extreme to severe drought. (http://droughtmonitor.unl.edu/DM midwest.htm)
