## Discussion

July 2013 temperatures were right around the historical (30-year, 1981-2010) averages. With a mean temperature of 71.95 was only 1.25 degrees below the norm. The highest temperatures were recorded towards the middle of the month, where we had nine consecutive days above the historical average for each day from the 15th through the 23 rd . Of these nine days, the first six also experienced lows well above average. Besides these six days, most of the daily lows were below average.
Total liquid-equivalent precipitation for this month was 1.33 in ., some 31 percent of the historical average total of 4.32 in . and the least to fall for the month of July since 2002. The record for least rainfall occurred in 1916 when only 0.20 " fell. Most of this fell at the beginning of the month and some towards the end. The nineday heat wave during the middle of the month only produced 13.5 percent of the total monthly precipitation total, and it fell within the last four days of said heat wave. The year to date liquid equivalent now stands at 28.15 ", still 6.56 inches above the year to date average of 21.59 in. This year has since fallen from being the wettest on record since 1902
